Lab 7

Dan Schepers

1) Selenium is powerful because it allows you to automate a browser in a way that simulates manual browsing. It also allows you to test the site and the web browser's interaction with the site.
2) There don't seem to be any drawbacks.
3) <tr><td>MyCase</td></tr>
4) <tr>

    <td>click</td>
    <td> //a[@id='myLink']/>
    <td></td>

    </tr>
5) Using HTML means that the developer won't have to learn another language to test the web site- they should already know HTML. The only minor drawback is the relatively large amount of HTML code required to generate a test.
